For immediate release: December 15, 2021

Subject line: **A moth's virtual reality**

(Tokyo, December 15) **Researchers build a multi-modal VR system to study the behavior of male silkmths searching for females using visual, wind, and odor signals, helping to shed light on how an insect deals with conflicting information**

A team led by the Graduate School of Engineering Science at Osaka University and the Department of Systems and Control Engineering at Tokyo Institute of Technology (Tokyo Tech) has shed light on the search behavior of moths using a specially constructed virtual reality system that can independently apply visual, wind, and odor stimulation. This work may help in the development of automated robots that can find chemical leaks or that operate in search-and-rescue environments.

The ability of most organisms to survive and reproduce depends on their navigation skill within an environment based on sensory information. Often, data from several modalities, such as vision and olfaction, must be successfully integrated in order to determine the correct behavior. This is particularly true for search tasks, such as looking for food or potential mates when an odor or pheromone signal is present. However, the mechanism by which insects can find the source of an odor, as well as the impact of conflicting data sources, are largely unknown.

To study this issue, the team built a virtual reality system for male silkmoths that could present odor, wind, and visual stimuli. Air flow was controlled for the front, back, left, and right sides of the moth. At the same time, a pheromone could be applied to the two antennae independently using odor discharge ports. A 360-degree array of LED lights, which rotated automatically based on the motion of the moth, provided visual feedback. “The VR system we developed for this study can monitor female search behavior in a complex environment,” study first author Mayu Yamada explains.

The behavioral experiments using the VR system revealed that the silkmoth had the highest chance of navigating successfully when the odor, vision, and wind information were accurately provided. However, the search success rate was reduced if the wind direction information was in conflict with the odor stimulus. In this case, the silk moth was seen to move more carefully. This reflected a modulation of behavior based on the degree of complexity of the environment.

The team recorded a migration probability map to visualize the effects of differences in environmental conditions on the behavioral trajectory. They developed a new mathematical model that not only succeeded in reproducing the silk moth search behavior, but also improved the search success rate relative to the conventional odor-source search algorithm.

“We think that this multi-sensory integration mechanism will help with the motion algorithm of automated rescue robots,” senior author Shunsuke Shigaki says. This would allow search robots to find chemical leaks more efficiently.

About Osaka University

Osaka University was founded in 1931 as one of the seven imperial universities of Japan and is now one of Japan's leading comprehensive universities with a broad disciplinary spectrum. This strength is coupled with a singular drive for innovation that extends throughout the scientific process, from fundamental research to the creation of applied technology with positive economic impacts. Its commitment to innovation has been recognized in Japan and around the world, being named Japan's most innovative university in 2015 (Reuters 2015 Top 100) and one of the most innovative institutions in the world in 2017 (Innovative Universities and the Nature Index Innovation 2017). Now, Osaka University is leveraging its role as a Designated National University Corporation selected by the Ministry of Education, Culture, Sports, Science and Technology to contribute to innovation for human welfare, sustainable development of society, and social transformation.

About Tokyo Institute of Technology

Tokyo Tech stands at the forefront of research and higher education as the leading university for science and technology in Japan. Tokyo Tech researchers excel in fields ranging from materials science to biology, computer science, and physics. Founded in 1881, Tokyo Tech hosts over 10,000 undergraduate and graduate students per year, who develop into scientific leaders and some of the most sought-after engineers in industry. Embodying the Japanese philosophy of “monotsukuri,” meaning “technical ingenuity and innovation,” the Tokyo Tech community strives to contribute to society through high-impact research.
